

CREDITAX.AI · NIGERIA

# Where tax filing becomes credit standing.

Here's what Nigerians can do: **ask a tax question and get the statute cited.** Calculate PAYE, VAT, and withholding down to the section. And build a **compliance-backed credit health score** that lenders can actually read. When it matters, CAC-verified professionals are one tap away.

The compliance layer between what Nigeria earns and what it can borrow.

## INDEX

|                   |    |                   |    |

# Why the tax advice layer failed after the 2023 reform

The reform changed the rules, and the advice layer never caught up. The gap gets paid in penalties and interest.

## What the reform changed

### NTA and NTAA 2023

Two new acts, the Nigeria Tax Act and the Tax Administration Act, replaced the old framework with **17 PAYE bands**, a redrawn withholding schedule, and a new filing procedure.

### CGT amendments

Capital gains rules for individuals changed along with everything else, and freelancers and small investors were caught off guard.

### Deadlines didn't soften

Every obligation kept its date. Penalties for guessing wrong arrive by post, with interest.

## How people cope today

### One accountant, if they can afford one

Trusted, expensive and concentrated in cities. The informal majority has no access at all.

### Search engines and AI chat

Confident, fluent and **unmoored from jurisdiction**. Foreign or stale rules look identical to correct ones until they cost a penalty.

### FIRS publishes for practitioners

The authoritative source exists: guides, circulars, the statute itself. It is simply **not written for the nurse in Surulere or the POS agent in Kano**.

## WHERE CREDITAX ENTERS

Not “file your taxes.” Our wedge is money that has already been earned and already withheld by a client, sitting unclaimed. Our first service, **WHT Credit Recovery**, matches the deductions to the missing credit notes, assembles the claim schedule, and a verified professional files it. **Creditax keeps 5% of what comes back.**

# The four types of taxpayers in Nigeria, and the record each one is missing

Each one earns a living differently, and each is missing the same thing: a record a lender, client, or regulator can read.

## The Employee

 PAYE • TCC

They're taxed at source, but they're not sure the payroll figures are right. And when a **visa or loan** asks for a Tax Clearance Certificate, putting one together is a paper chase across employers and banks.

## The Trader

 INFORMAL INCOME

Real earnings, zero paperwork. The bank sees the account, not the trade. The result is a **thin file**: no credit history, no pricing power, no record a lender will read.

## The SME Owner

 VAT • WHT • CIT

Three obligations, one operator, no retainer. Withholding is **deducted by clients and rarely reclaimed**; VAT is remitted by feel; CAC filings lapse.

## The Professional

 SUPPLY SIDE

The expertise is there, but clients find it **by word of mouth and street sign**. Bulk calculations are manual, verification is manual, and the people who need help most can't tell a real professional from a card in the market.

### WHAT THEY SHARE

Every one of them is missing the same thing: a **verifiable record of their compliance**. The employee's filing streak. The trader's declared income. The SME's remittance history. The professional's standing. Today, none of it exists in a form a lender, client, or regulator can read.

### WHY THE PLATFORM SEES IT

Everyone here is already doing the behaviour on Creditax: asking the question, running the calculation, uploading the document, claiming the credit. The record **builds itself out of that work**. No one fills out a form to create it.

# The four numbers of the 2023 reform that our answers cite

The platform cites provision by provision, and re-indexes when the law moves.

**17**

PAYE bands under NTA 2023  
Schedule 1: the ladder every  
salary now sits on

**7.5%**

standard VAT, with a Schedule 2  
exemption list most filers cannot  
name

**5–30%**

withholding range by payment type  
and recipient status

**10%**

capital gains for individuals under  
the 2024 amendments

## What we cite, and where it lives

### PROVISION

### WHERE IT LIVES

Personal income tax bands and reliefs

**NTA 2023, Sch 1**

VAT standard rate and exemptions

**FIRS VAT Guide**

Withholding by payment type

**NTA 2023, s.15**

Company income tax, small-company relief

**NTA 2023**

Capital gains, individual disposal

**CGT amendments 2024**

Every answer names the instrument, the section and the schedule it rests on.

## Versioned, not improvised

When a circular changes, the knowledge base **re-indexes**, and the citation trail moves with it. When FIRS publishes, we update. When FIRS is silent, we don't guess. Keeping that discipline is expensive, and **that expense is the moat**.

**Re-index trigger**, new circular or amendment

**SCHEDULED**

**Citation trail**, moves with the version

**VERSIONED**

**Silence rule**, no source, no answer

**HARD**

## WHAT CREDITAX WILL NOT DO

We don't scrape, we don't piggyback on government systems, and we never answer from a model's memory. The only source is **published law**, **cited on every answer**. That's the product itself, not a compliance afterthought.

# The credit signal lenders are missing: whether you file, pay, and keep records

Open banking shows money moving; nobody scores the discipline behind it. Creditax does.

## Two records, one person, no connection

Bank statements show **flow**: money in, money out. What they don't show is whether the person **files, pays, or keeps records**. Consistency is one of the clearest discipline signals a person can show, and it's something we produce naturally, as a by-product of the work we already host.

That's why we score it. A **compliance-weighted credit health score** sits alongside the bank-data factors, clearly labelled as **indicative, for education and self-improvement**. It's not a bureau report, and bureau data only comes in through partnership, as the bureau's own report.

## How the score is built

|                                                         |            |
|---------------------------------------------------------|------------|
| <b>Income stability</b> , from bank data                | <b>30%</b> |
| <b>Compliance history</b> , filings, payments, activity | <b>30%</b> |
| <b>Savings rate</b> , statement analysis                | <b>25%</b> |
| <b>Debt burden</b> , existing loan payments             | <b>15%</b> |

With BVN, NIN, TIN, and CAC rails, plus mobile reach, this signal can now be linked to a person for the first time.

## THE DATASET ARGUMENT

Every interaction builds a record that no one else has: **verified compliance behaviour, linked to identity rails, across tax types and four languages**. You can't buy that. It takes a year of real usage to earn, and the gap only widens every month we're live.

# The Creditax tax-and-credit system: one loop across four surfaces

Everything the user does feeds one file: the answer, the calculation, the upload, the score.

## The loop, end to end

### 1 · Ask in your language

The interface, and the answers, come back in **English, Yoruba, Hausa, or Igbo**. Every reply is grounded in published Nigerian law, and it names the section it's citing.

### 2 · Calculate, then cite

Our four calculation engines (**PAYE, VAT, withholding, corporate**) return the same figure for the same inputs, every time. And every figure names its section of the law. **No black boxes.**

### 3 · Upload and extract

Receipts, invoices, and payslips land in the document library, and the platform previews what it extracted. You can attach any of them straight into the conversation.

### 4 · Score and refer

Your score updates as you act. And when our confidence drops below a set bar, we don't guess, we **book a verified human for you**.

**LIVE PRODUCT** [creditax.missionctrl.com.ng](https://creditax.missionctrl.com.ng)

## Four surfaces, one engine

**Consumer**, canvas, uploads, **FREE TO START** score

**Pro portal**, clients, bulk calc, **N25,000/MO** white-label

**Developer API**, keys, sandbox, **USAGE-BASED** metering

**Admin**, approvals, KB, audit **INTERNAL**

# The service schedule: a fixed input, output, and price for every service

The schedule below is the whole revenue model: six services, each with a fixed published price.

## Services, each with a fixed price

| SERVICE                    | WHAT THE USER GETS                                                        | FEE                        |
|----------------------------|---------------------------------------------------------------------------|----------------------------|
| <b>WHT Credit Recovery</b> | Deductions matched to missing credit notes; claim schedule filed by a pro | <b>5% of recovery</b>      |
| <b>TCC Readiness</b>       | Live tracker, missing-document list, assembled bundle with countdown      | <b>₦2,500 / pack</b>       |
| <b>Ajo Ledger</b>          | Cooperative contributions logged; per-member income certificate           | <b>₦100–200 / member</b>   |
| <b>Employer Badge</b>      | Monthly PAYE audit, dated badge, regulator-ready report                   | <b>₦200–500 / employee</b> |
| <b>Notice Translator</b>   | Any FIRS or state notice explained in plain or local language             | <b>1 free / month</b>      |
| <b>Invoice Checker</b>     | “Deduct this, remit by then”, before the invoice is paid                  | <b>3 free / day</b>        |

## Services, not screens

You don't have to hunt for a menu; the assistant **suggests a service mid-conversation**, when your question matches. And it's the schedule that scales, not the interface: new revenue comes from new rows, not new screens.

**Fixed input**, a question, document or invoice

**DEFINED**

**Fixed output**, a claim, bundle, badge or report

**DEFINED**

**Fixed price**, published in the tariff

**VISIBLE**

### ⌚ WAVE TWO, ALREADY SPECCED

Rent withholding autopilot, a salary-structure optimiser, a payslip decoder, a business-name quiz. Each one ships **only when its prerequisite is in place**: marketplace supply, disclaimers, score credibility. These are options, not promises.

# The professional marketplace: how a verified badge is earned

Four checks before a professional is visible, and discovery that reads intent.

## How the verified badge is earned

### 1 · Registry check

The CAC registration number is validated through **Mono's lookup API**. Because there's no official public CAC API, we corroborate the registry hit; we never trust it on its own.

### 2 · Documentary proof

The CAC certificate itself is uploaded and stored against the profile.

### 3 · Human review

An administrator approves or rejects from a queue. **No profile goes live unreviewed.**

### 4 · Gated contact

Phone, email, and WhatsApp only show **to signed-in users**, and never appear on public pages. Anti-scrape, by design.

**LIVE MARKETPLACE** [browse the supply](#)

## Discovery that reads intent

Type “I need a VAT expert near Lagos Island” and you get back the professionals whose services match, **sorted by distance** if you share your location. And the referral happens at the moment the stakes are highest: audits, objections, appeals.

# Pricing: four tiers, all in naira, enforced on the server

Tight free limits by design, and a published 20% annual discount.

## FREE

### N0

- ☐ 5 answers / day, 60 lifetime
- ☐ 5 calculations / day
- ☐ 2 uploads / day
- ☐ Starter credit score
- ☐ 100 sandbox API calls

NO CARD REQUIRED

## PLUS · POPULAR

### N5,000 /mo

- ☐ 100 answers / day
- ☐ 50 calculations / day
- ☐ 20 uploads / day
- ☐ Full score + simulator
- ☐ 5 BVN · 5,000 API calls

N4,000/MO BILLED ANNUALLY

## PROFESSIONAL

### N25,000 /mo

- ☐ Fair-use unlimited
- ☐ Client files · 3 seats
- ☐ White-label reports
- ☐ 20 BVN checks
- ☐ 50,000 API calls

3 SEATS INCLUDED

## ENTERPRISE

### Custom

- ☐ Pooled quotas
- ☐ Portfolio scoring
- ☐ SSO + SLA
- ☐ Nigeria-region hosting
- ☐ Dedicated support

SLA-BACKED

### ANNUAL PULLS CASH FORWARD

On annual billing, Plus drops to **N4,000/month** and Professional to **N20,000/month**, a fixed 20% discount. And **you'll never see a dollar figure anywhere**, not in the product and not in this deck.

### ENFORCED, NOT DECORATIVE

Quotas live in the server's middleware, so they can't be fudged. When you hit the cap, the upgrade prompt **names your exact limit**, and every admin override is logged. Your 6th free answer of the day is the wall.

# Unit economics: what it costs to serve a user, documented to the naira

Every figure is a documented cost or a labelled scenario, and one conversion funds seven free users.

**₦370**

typical free-user cost per month  
(ceiling ₦1,500: the lifetime cap binds first)

**74%**

margin on BVN verification: ~~₦350~~  
price against a ~~₦90~~ provider cost

**~55%**

Plus margin, typical user:  
Professional runs ~73%,  
Enterprise floored at 60%

**1:10**

conversion target: one Plus per ten  
active free users within 90 days

## Cost of service: documented unit costs

| ACTION                       | UNIT COST     |
|------------------------------|---------------|
| Grounded answer              | <b>₦5</b>     |
| Tax calculation              | <b>₦3</b>     |
| Document upload + extraction | <b>₦15</b>    |
| BVN verification (provider)  | <b>₦90</b>    |
| <b>Free-user ceiling</b>     | <b>₦1,500</b> |

Unit costs revalidate monthly against provider invoices.

## What one conversion is worth

| LINE                         | FIGURE              |
|------------------------------|---------------------|
| One Plus contributes / month | <b>~₦2,750</b>      |
| That contribution pays for   | <b>~7 users</b>     |
| Plus / Professional margin   | <b>55% / 73%</b>    |
| Enterprise floor             | <b>60%</b>          |
| <b>Payback rule</b>          | <b>&lt; 90 days</b> |

Margins are contribution after direct service cost.

## Month-6 scenarios

|                           |                 |
|---------------------------|-----------------|
| <b>A conservative MRR</b> | <b>₦252,500</b> |
| contribution              | <b>₦174,500</b> |
| <b>B funded MRR</b>       | <b>₦930,000</b> |
| contribution              | <b>₦740,000</b> |

### ⚠ NO NUMBER GAMES

We re-verify these unit costs every month against provider invoices. A provider that moves **20%** forces a quota re-cut before any price change.

# What we have shipped, what is in build, and what is gated

Two tracks, one rule: the demo sells, production ships, and nothing crosses the line.

## Shipped on the demo track

- ✓ **48 routes** across consumer, pro, admin and developer surfaces
- ✓ Canvas chat with citation cards and extraction previews
- ✓ Marketplace grid, profiles, admin approval queue
- ✓ Naira-locked pricing, quota walls, usage counters
- ✓ Four-language interface: EN · YO · HA · IG
- ✓ Status surface, all services green

## On the production track

- ✓ Managed Postgres with retrieval; real identity (BVN / NIN)
- ✓ Payments and metering against live providers
- ✓ Background jobs, re-indexing, monitoring

**System status**

↑ All services operational — 5/5 live - demo\_seed

This board is sample data for the demo build. Figures below are illustrative and are not a service guarantee.

**All systems operational**  
All 5 services are operating normally.

- API Server**  
Median response 260ms across the tax-calculation endpoint.
- RAG Chat Engine**  
Grounded answers from the tax corpus, cited on every response.
- Document Processing**  
Receipt / invoice extraction pipeline healthy.
- Auth System**  
Direct-email sign-in and portal role routing healthy.
- Marketplace API**  
Provisioned endpoints and responsive status.

**LIVE STATUS** [creditax.missionctrl.com.ng/en/status](https://creditax.missionctrl.com.ng/en/status)

## THE TWO-TRACK RULE

The demo track runs on **seeded data that's clearly labelled**, and its job is to sell. The production track is where the real integrations live. Nothing from one is ever presented as the other.

# How we win clients: show it live, publish the answers, staff the supply

Three moves in order, and every one of them is verifiable on the live product.

## 1 Show it on camera

We've written an **eight-minute script** that runs the product end to end, and we use it on 4–5 warm leads: tax-reporting fintechs, government-adjacent projects, accountancy practices. And we only pitch what we can show live.

## 2 Publish the answers

The questions people are asking in this reform era become articles, each **signed off by a licensed practitioner** before publication. And because the developer surface ships with **free sandbox access**, fintechs and payroll tools end up building on the same engines.

## 3 Staff the supply

We onboard verified professionals **before we start spending on customer acquisition**. And the practice tooling (bulk calc, white-label reports) makes it worthwhile to join even when you have few clients, so supply never stalls while demand is building.

The screenshot displays the 'Sandbox' section of the Creditax.ai Developer Surface. It includes a sidebar with navigation links like 'Quickstart', 'API Explorer', 'Sandbox', 'API Reference', 'Tools', and 'Webhooks'. The main content area is titled 'Sandbox' and describes testing the Creditax.ai API without affecting real data. It shows a 'Sandbox' environment selected over 'Production', a 'Your Sandbox API Key' section with a key 'sk\_test\_\*\*\*\*\*9c00' and a 'Copy' button, and a 'Sandbox Capabilities' section listing features like 'Tax Calculations', 'AI Tax Assistant', and 'Document OCR', each with a 'Sandbox' toggle.

DEVELOPER SURFACE [creditax.missionctrl.com/ng/en/developers](https://creditax.missionctrl.com/ng/en/developers)

## The weekly KPI contract

**Activation**, first-session win (ask, upload, score) **20%**

**Conversion**, within 90 days **1 : 10**

**Trust**, citation coverage on answers **100%**

**Economics**, blended CAC envelope **₦2,000**

**Supply**, verified pros and contact reveals **WEEKLY**

# The moat: three advantages a competitor cannot buy

Maintenance discipline, a dataset that compounds, and the trust infrastructure to hold it.

## 1 Cited Nigerian depth

The rules we version, a golden test set of Nigerian tax questions, and a confidence bar we **refuse to answer below**. The barrier isn't the technology. It's the unglamorous work of keeping published law current, answer by answer, every time it changes.

## 2 The compliance dataset

Bank statements show flow, but no one is scoring filing behaviour. Every calculation, estimate, and verified document we handle makes that archive deeper: it **compounds monthly**, and it can't be bought after the fact.

## 3 The verified network

Our professionals are CAC-checked, their contact details show only to signed-in users, and the practice tooling keeps them around. **A directory can be scraped. Trust infrastructure cannot.**

## Who else is near this problem

### PLAYER CLASS

### WHY THEY MISS

**Generic assistants**

No citation contract; foreign or stale rules look identical to correct ones

**Global tax suites**

Built for home-market filing rails; no Nigerian depth, no compliance bridge

**Banks and bureaus**

Compliance behaviour sits outside their scoring frames

**Status quo**

Zero records, zero scale, trust by proximity only

### ⚠ THE HONEST CAVEAT

To be clear: this moat is **earned in operation, not claimed in a deck**. It only exists insofar as the citations hold, the data compounds, and the supply stays. We measure all three (see the audit log, section 16).

## The 24-week delivery plan, gated by four measured exits

Four phases, each ending only when its measured KPI is met.

**I** Weeks 1–5 ·  
Foundation + Core  
API

Set up the brand, file with the CAC, stand up the repository, and build the API keys, rate limits, and first calculators.

**We're done when a partner can compute PAYE from our documentation alone.**

## II Weeks 6–12 · Assistant + Documents

Ingest the knowledge base, ship cited answers, and get uploads, extraction, and reports working. **We're done when invoice-to-extraction-to-report runs end to end.**

### III Weeks 13–20 · Credit + Platform

Ship score v1, identity verification, the sandbox, webhooks, and usage analytics. **We're done when the starter score and the developer surface are live.**

#### IV Weeks 19–24+ · Marketplace + Launch

Run CAC verification, profiles, and proximity search, then launch publicly. **We're done when the first verified professional is live and the first paying conversions are measured, not modelled.**

## THE SEQUENCING RULE

Every phase ends on a **measured KPI, not a date**. Hardware is out of scope for phase one, at any price. We staff supply before we spend on customers. And because the production data gate is funded inside the budget, it can't become the excuse for delay.

## WHAT THE PHASES BUY, IN ORDER

Two-fifths of every naira builds the product, and a quarter buys adoption. **12% runs the infrastructure, and 8% opens the legal road.** The remaining 15% is operations and buffer, released only when a listed trigger hits (detail in section 15).

# Where the ₦10,000,000 goes, month by month

The appropriation, the monthly drawdown, and exactly what the contingency covers.

## Appropriation schedule

| ALLOCATION              | AMOUNT             | SHARE       |
|-------------------------|--------------------|-------------|
| Engineering and product | ₦4,000,000         | 40%         |
| Go-to-market            | ₦2,500,000         | 25%         |
| Infrastructure          | ₦1,200,000         | 12%         |
| Compliance and legal    | ₦800,000           | 8%          |
| Operations              | ₦500,000           | 5%          |
| Contingency             | ₦1,000,000         | 10%         |
| <b>Total instrument</b> | <b>₦10,000,000</b> | <b>100%</b> |

## Monthly drawdown (N millions)

| MONTH             | DRAW         | FOCUS                              |
|-------------------|--------------|------------------------------------|
| Month 1           | 1.45         | Scaffold, brand, CAC filing        |
| Month 2           | 1.60         | API skeleton, key management       |
| Month 3           | 1.65         | Assistant and knowledge base live  |
| Month 4           | 1.70         | Documents and credit engine        |
| Month 5           | 1.75         | Marketplace and developer platform |
| Month 6           | 1.85         | Launch and production gate         |
| <b>Cumulative</b> | <b>10.00</b> | <b>contingency triggered</b>       |

## WHAT CONTINGENCY COVERS

What it covers: provider prices moving **more than 20%**, a security review before any bank contract, identity demand outpacing the teaser budget, and runway into month seven if conversion runs light. It absorbs drift, and it never funds new scope.

## WHAT IT ENDS WITH

Six months in, you have a demo-stable product across **48 routes**, a cleared legal gate, verified marketplace supply, a conversion mechanic we've actually measured, and the first tranche of a dataset nobody else holds.

## The risk register: eight risks, each with a mitigation and a watcher

What would actually hurt, in severity order.

**CRITICAL**

## Ungrounded tax answers

Citations are mandatory on every reply; a golden test set and the confidence bar catch what slips through.  Watch: citation coverage · referral rate

MED

## Provider concentration

Provider pinned per environment, the demo path fails closed, and multi-provider notes are kept. © Watch: provider error rates

## HIGH

## NDPA / NDPC non-compliance

Impact assessment before production, NDPC registration, a DPO from day one, and a 72-hour breach workflow. [Watch: gate milestones](#)

MED

### Conversion below target

Quota walls name the limit; the annual discount and the identity teaser build the paid habit. © Watch: cohort conversion curves

HIGH

## Regulatory change

Rules are versioned, we re-index on schedule, and the citation trail moves with every amendment. © Watch: re-index lag

MED

## Marketplace supply stall

Supply acquisition comes before consumer spend; the practice tooling pays for itself early. © Watch: verified pros · reveals

## HIGH

## Free-tier cost blowout

A lifetime 60-answer cap plus server-side quotas: worst case  
¥1,500 per user against a ¥2,000 envelope. ☹ Watch: cost per  
active free user

LOW

## Payment fraud

Local PSP with 3-D Secure, verified webhook signatures, and no card data on our servers. ☹ Watch: chargeback rate

## The legal path: sequenced and funded inside the raise

Four stages, each tied to where the product is: company, demo, production, bank deals.

## 1 Now · Company

Register the operating company with the CAC, engage counsel, open the corporate account, and get the company its own TIN. **A platform that does taxes files its own paperwork first.**

## 2 Demo · Assessment light

A lightweight DPIA, on **mock data only**, plus a draft privacy notice in English. The demo keeps moving while the gates run in parallel.

### 3 Production · Full gate

**Register with the NDPC** as a data controller of major importance, complete the full impact assessment, put a Data Protection Officer on paper, and ship notices in four languages.

## 4 Bank deals · Assurance

A penetration test, data-residency answers, and SLA and DPA templates ready for institutional review.

## Two lines that never move

## The FIRS line

We don't scrape, and we don't unofficially integrate with any government system. **Only published law and guidance, cited on every answer.** General information, never representation: high-stakes matters route to a verified human.

## The CBN line

We're not a licensed credit bureau, and we're never presented as one. The score is **indicative, for education and self-improvement**. Bureau data only comes in through partnership, as the bureau's report. And we don't lend from our own balance sheet.

## 📈 WHY INVESTORS SHOULD LIKE THE GATE

A competitor that skips this carries **regulatory debt it never booked**. And because the gate is funded and sequenced inside the ₦10,000,000, the launch date is honest.

# How we classify, protect, and delete the data we hold

Four classes, four rules each, and the 72-hour path when something goes wrong.

## The classification

**Restricted**, BVN, NIN, TIN, tokens, secrets

**NEVER RAW**

**Confidential**, statements, filings, credit factors

**ENCRYPTED**

**Internal**, tickets, counters, reviews

**STAFF ONLY**

**Public**, blog, docs, pro profiles

**RATE-LIMITED**

## The locked rules

- ✓ **We never store raw BVNs or NINs.** We keep the verdict, the provider reference, and a last-three hint. The number itself lives in request memory only.
- ✓ **We never see bank credentials.** Read-only tokens, encrypted, revocable from the user's dashboard.
- ✓ **Contact details show only to signed-in users**, and never appear on public pages. Anti-scrape, by design.
- ✓ **We strip identifiers before processing**, so personal data never reaches logs or engines unredacted.

Consent is granular, receipts are logged, and export and delete are self-serve, in all four languages.

## When things go wrong

**Breach response**, assess, contain, notify NDPC and users

**72 HOURS**

**Cross-border processing**, lawful basis plus redaction

**GATED**

**Data-subject rights**, export and delete

**SELF-SERVE**

# The ask: ₦10,000,000, sequenced against four investor checkpoints

What the money buys, what it releases, and what this document does not claim.

**₦10M**

seed instrument: structure and branches open to discussion

**6** mo

runway to launch and the production data gate

**4**

checkpoints, each gated on a measured KPI

**0**

unfunded compliance gates: the legal road is inside the budget

## The checkpoints

**Month 3**, demo stable: the eight-minute script runs end to end

**M3**

**Month 4**, production gate: NDPC filed, DPIA complete, DPO on paper

**M4**

**Month 6**, launch: first paying conversions measured, not modelled

**M6**

**Month 6+**, supply proven: first verified professionals live in the marketplace

**M6+**

Each checkpoint releases the next tranche of the plan; none depends on a calendar date alone.

The six-month instrument, sequenced against the delivery schedule in section 14.

### ⚠ WHAT THIS DOCUMENT DOES NOT CLAIM

We don't have revenue yet. We haven't run a pilot. We don't have signed enterprise contracts. Hardware is out of scope. Every forward figure in this document is a labelled scenario. **The ask funds evidence, not aspiration.**

TAX SMART. BORROW SMART.

# A record of what Nigeria earns, owes and **files**.

The record is built where the filing happens, priced where the credit is decided, and referred to a **verified human** when the stakes demand one. That's the whole product, and that's the whole moat. **Next step:** thirty minutes with the live product. Demo, full financial model, checkpoint plan.
